# PLASMA SURFACE TREATMENT

## SURFACE ACTIVATION AND MICRO CLEANSING

The PST system is an essential tool for cleaning and surface activation of various materials: plastics, metals, fabrics, leather, ceramic and composite materials, glass, etc.

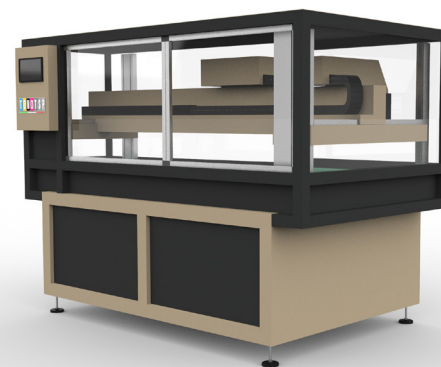

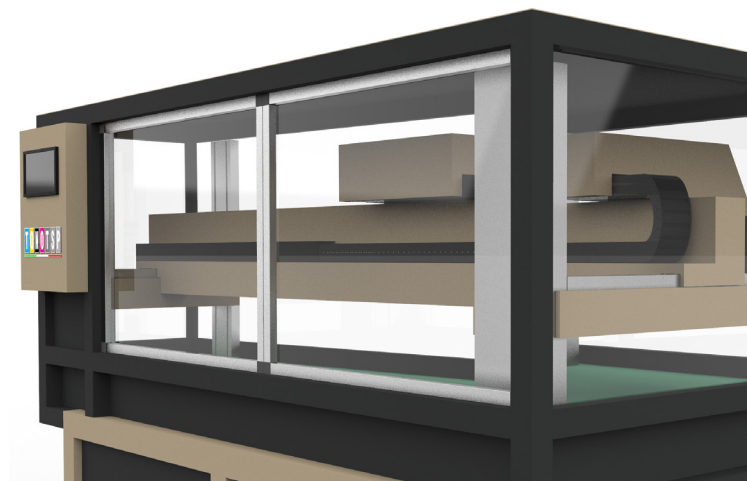

The pre-treatment with PST ensures perfect cleaning thanks to the degreasing action and selective removal of surface contamination.

PST is the most used pre-treatment when the surface of the material needs to be printed or laminated.

PST was created to improve the wettability and therefore the action of our inks on a large scale of materials, respecting the nature of the original product, even in the case of temperature-sensitive materials.

PST can also be used for the sedimentation of super thin organic and hybrid layers that replace the common solvent primers, ensuring superior adhesion with an eco-friendly process.

# IMPROVED WETTABILITY AND OVERPRINTING.

# NO LIMITS.
